Roundup Ready Soybeans.....	39-46
Sunflowers.....	47-49
Corn	50
Camelina, Energy Sugarbeet	51
Crop Disease and Production Research.....	52-58
Foundation Seed Increase.....	59

The 2011 annual research report is intended to provide producers information to aid in selecting varieties and/or hybrids. Variety information and research reports on crop disease and production can also be found at our website www.ag.ndsu.edu/langdonrec/. Variety trial results from all NDSU Research Extension Centers and the Main Station at Fargo, along with crop extension bulletins, can be accessed on the web at www.ag.ndsu.edu/varietytrials/.

Choosing a variety is one of the most important decisions a producer makes in successful crop production. Characteristics to consider in selecting a variety may include yield potential, disease resistance, protein content when grown with proper fertility, straw strength, plant height, test weight, yield stability across years and locations, quality and economic profitability. A variety's performance may differ from year to year and from location to location within a year due to varying environmental conditions. When selecting a variety to grow it is best to consider a variety's performance over several years and locations.

The agronomic data presented in this publication are from replicated research plots using experimental designs that enable the use of statistical analysis. The trials are designed so that "real" yield and agronomic differences can be statistically separated from differences that occur by chance. The least significant difference (LSD) values given in the report are used for this purpose. For example, if the LSD 5% is 5 bushels, then if the difference between any two varieties is greater than 5 bushels they are said to be significantly different from one another 95 times out of 100 under those growing conditions. If the difference between two varieties is less than 5 bushels, they are not significantly different from one another. If there is a "NS" for LSD 5% value it means there was no real difference between any varieties or the trial was too variable to detect a real difference. The CV stands for coefficient of variation and is expressed as a percentage. The CV is a measure of variability in the trial. Large CVs mean that a large amount of variation could not be attributed to differences in the varieties or agronomic characteristic.

The NDSU Langdon Research Extension Center, in addition to its on-station research program, conducted variety research trials at five off-station locations in 2011. Trial locations were at Cavalier, Park River, Voss, Lakota, Devils Lake, Cando and Willow City. These locations are in cooperation with the farmer, the Extension Service and the County Agricultural Improvement Association.

2011 Weather Summary

Fall recharge at Langdon for September through October 2010 was 7.32 inches, 4.09 inches above normal. Precipitation from November 2010 through March 2011 was 1.9 inches, 1.31 inches below normal. Snowfall for the 2010-2011 was 58.2 inches, 20.4 inches above normal. Spring planting was delayed until the latter half of May because of the saturated soil conditions. Prevented plant acres for the nine counties in northeast North Dakota was 772,000 acres. Rainfall was generally above normal across the region April-September except for most of Cavalier County, western Walsh and extreme eastern Ramsey County. Temperatures were below normal in April-May, near normal in June and above normal July-August. This was especially favorable for the warm season crops because of the late planting. Yields varied considerably across the region but given the late planting date were generally fair to good. Harvest conditions were excellent throughout the fall. A frost/freeze September 14th and 15th ended the growing season around the region. The warmer than normal temperatures starting in July prevented serious crop damage in the warm season crops.

2011 Crop Management - Langdon						
Field Trial	Previous Crop	Seeding Rate Unit/Acre	Yield Goal	Planting Date	Harvest Date	Row Spacing
Barley	drybean	1.25 million pls	120 bu	May 18	Aug. 23	6
Camelina	soybean	5 lbs	1500 lb	May 19	Aug. 24	6
Canola - LL, CL	soybean	610,000 pls	2500 lb	May 25	Aug. 31	6
Canola - RR	soybean	610,000 pls	2500 lb	May 25	Aug. 31	6
Corn	wheat	28,000 thinned	110 bu	May 16	Oct. 20	30
Durum	soybean	1.50 million pls	60 bu	May 17	Sept. 7	6
Drybean	wheat	70-90,000 pls	2500 lb	June 2	Sept. 26	30
Field Pea	soybean	300,000 pls	60 bu	May 19	Aug. 30	6
Flax	soybean	2.8 million pls	40 bu	May 19	Sept. 19	6
HRSW	soybean	1.50 million pls	60 bu	May 17	Sept. 6	6
HRWW	canola	1.2 million pls	100 bu	Oct.6,2010	Aug.15	7
Oats	soybean	1.0 million pls	120 bu	May 17	Aug. 25	6
Soybean - Conventional	soybean	200,000 pls	60 bu	May 19	Sept. 29	6
Soybean - RR	wheat	200,000 pls	60 bu	May 20	Sept. 29	6
Sunflower - Confection	wheat	17,000 thinned	2500 lb	June 2	Oct. 12	30
Sunflower-Oil	Wheat	20,000 thinned	2500 lb	June 2	Oct. 13	30
Soil Type - Svea-Barnes loam						

Special thanks to our local cooperators and Extension Agents for their efforts in our off-station variety testing.

a - 2010 data is an average of Tolna, Leeds and Lakota sites.

b - 2010 - with Fungicide = Prosaro at early flower, 6.5 oz/a + NIS 0.125% v/v

b - 2011 - with Fungicide = Stratego at herbicide time, 4oz/a + Prosaro at early flower, 6.5 oz/a + NIS 0.125% v/v

Height and lodging data is an average of fungicide and no fungicide plots

Winter Cereals

Sustainability in Action

Winter Cereals Sustainability in Action, in northeast ND, is a joint research and education initiative between Ducks Unlimited, Bayer Crop Science, NDSU Extension Service and NDSU Langdon R/E Center. The objective is to improve agricultural productivity of winter wheat. Increased winter wheat acres will provide improved habitat for wildlife in areas with low levels of grassland. This program provides all salaries and operating funds for the winter wheat effort based at the NDSU Langdon R/E Center. The research on winter wheat includes varieties, fungicides, fertility and weed control. Contact John Lukach at the Langdon R/E Center for additional information.

¹Maturity Group provided by company

All lines are commercially available except those designated experimental².

³Days to physiological maturity at R7 stage (one brown pod on the main stem obtains mature brown or tan color.)

Yield, oil and protein reported at 13% moisture.

Frost between 29-32°F occurred on September 14-15 in the region. Limited damage on the trial appeared in the upper portions of the plant. Plants continued to mature and no green seed damage was visible.

¹Maturity Group provided by company

²Days to physiological maturity at R7 stage (one brown pod on the main stem obtains mature brown or tan color.)

Yield, oil and protein reported at 13% moisture. 2 yr yield average includes Devils Lake 2010 data.

Frost between 29-32°F occurred on September 14-15 in the region. Limited damage on the trial appeared in the upper portions of the plant. Plants continued to mature and no green seed damage was visible.

Seed Treatment to 'Faller' Hard Red Spring Wheat to Improve Stand, Plant Biomass, Yield and Test Weight Langdon, 2011

Halley, S.* , Crop Protection Scientist and Arens, A., Research Technician.

Corresponding author* North Dakota State University-Langdon Research Extension Center Langdon, ND 58249. PH: (701) 256-2582, E-mail: Scott.Halley@ndsu.edu.

MATERIALS AND METHODS

Loveland Products, Inc. provided seven treatments and rates, Table 1, to be applied to hard red spring wheat seed (HRSW) as protectants prior to planting in 2011. An untreated was included as a control. The seed treatments were individually applied with a syringe to 2 lb. lots of HRSW at Langdon with a Hege Model 11 liquid seed treater (Wintersteiger Inc., Salt Lake City, Utah). The investigator included an untested biological compound, Table 1, with an adhesive (gum arabica) and an adhesive only from the lab of Dr. Bruce Bleakley from South Dakota State University for a total of ten treatments. The biological and adhesive were applied by Dr. Bleakley to Faller HRSW from the same lot used for the entire study. Faller is the most commonly planted cultivar in northeast North Dakota. The trial site was previously cropped canola. Seed was planted at 1.5 million pure live seed per acre, determined by blotter paper germination in vitro before the seed treatment was applied. The trial design was a randomized complete block with eight replicates. . Liquid nitrogen fertilizer (N) (28-0-0) was fall and spring applied by broadcast method at N rate of 60 lb./acre each time. The plots were seven rows wide six-inch row spacing and measured 20 feet long. An Almaco double-disk drill was used to seed the plots on 16 May. Stand was determined from two 36 inch segments of row at growth stage 1.25 leaves. Plant vigor was assessed at 4 leaf growth stage. No differences were determined. Plant biomass was calculated on a root and foliage sample from 36 inches of row differentiated by the soil line at 4 leaf growth stage. Sample values are reported wet and dry. After weighing, wet samples were dried in a convection oven at 110° F until all the samples had reached equilibrium and a dry weight was recorded, Table 1. A solution of Caramba fungicide and Induce adjuvant (Helena Chemical Co.) was applied at 14 fl. oz. /acre and 0.125%v/v at early anthesis growth stage with tractor mounted sprayer. Caramba fungicide (manufactured by BASF), applied at Feekes growth stage 10.51, is recommended to reduce the effects of FHB in small grains. Plots were harvested with an Almaco SPC 20 plot combine and yield and test weight determined. Data was analyzed with the general linear model (GLM) in SAS. Fischer's protected least significant differences (LSD) were used to compare means at the 5% probability level, Table 1.

RESULTS

Stand was positively affected by the addition of Foothold Extra, Bio-Forge and LI 6194 although not always statistically. LI 6132 and the biological adhesive and the biological experimental had a negative effect on stand, Table 1. No differences in root weight were determined. Wet and dry foliage biomasses were similarly affected. The biological fungicide treatments had lower biomass than the Loveland treatments. The LI 6132 was not statistically different from the other treatments but numerically ranked last in foliage biomass weight.

Several treatments increased yield over the untreated including the Foothold Extra and Stamina treatment and Foothold Extra. Although not statistically different from the untreated, the LI 6132 and Foothold Extra and LI 6194 and Foothold Extra had yields that were statistically the same as treatments from the two greatest yields. The Bio-Forge treatment was not different from the untreated yield. The biological

treatments had a negative effect on test weight decreasing it by about 0.5 lb. / bu. from most of the other treatments.

Durum Uniform Fungicide Study, Langdon 2011

Scott Halley and Amanda Arens, North Dakota State University-Langdon Research Extension Center, Langdon, North Dakota, 58249 Ph.701-256-2582. E-mail Scott.Halley@ndsu.edu

Objectives

The study objectives were to determine if fungicides in the strobilurin fungicide class increase deoxynivalenol concentration in the seed compared to an untreated and if a triazole fungicide applied after a strobilurin fungicide could negate or reduce the effect of the strobilurin on DON accumulation.

Materials and Methods

A field experiment was planted on 4 May at the North Dakota State University Langdon Research Extension Center located at Langdon in NE North Dakota. The trial was conducted using best management practices for hard red spring wheat including seeding date and rate, fertility, weed control and harvest management. The experiment was a randomized complete block design with four replications. The previous crop was small grains. The soil type was Svea-Barnes loam. Divide durum wheat cultivar was seeded at a rate of 1.5 million pure live seeds /acre. Plots seven rows wide by 20 ft. long, 6-in row spacing were planted with an Almaco plot planter equipped with double disk openers and press wheels. A border plot was planted between treated plots to minimize interference from spray drift. Fusarium inoculums consisting of several isolates were hand-broadcast at a rate of 150 grams /plot three and two weeks prior to flowering to encourage development of Fusarium head blight disease (FHB). After herbicide application was completed an overhead irrigation system was installed to provide supplemental water to wet the inoculum and the grain heads to encourage the development of FHB. Fungicide treatments, rates and application timings are listed in Table 1. The primary active ingredients for the treatments were Cogito-blend of propiconazole and tebuconazole, Caramba-metconazole, Prosaro-blend of tebuconazole and prothioconazole, Headline-pyraclostrobin, Quadris-azoxystrobin, Evito-fluoxastrobin, Stratego YLD-blend of trifloxystrobin and prothioconazole, Quilt-blend of propiconazole and azoxystrobin, Twinline-blend of pyraclostrobin and metconazole. The fungicides were applied with a CO₂-pressurized backpack sprayer operated at 40 psi and delivering 18.4 GPA. The sprayer was equipped with a three-nozzle boom, nozzles spaced 20 inches on center. The foliar treatments were made using Spraying Systems XR8002 nozzles oriented vertically. The flowering treatments were made using Spraying Systems XR8001 nozzles mounted on a double swivel and oriented to spray forward and backward 30 degrees downward from horizontal. The fungicide applications were made at Feekes growth stage 9. 10.5 or 10.51 on 27 June (wind NW speed 3 MPH, temperature 55° F at 10:15 a.m.), 8 July (wind SE speed 3 MPH, temperature 70° F at 8:00 a.m.) or 11 July (wind West speed 3 MPH, temperature 66° F at 10:30 a.m.) by maturity. Fusarium head blight (FHB) incidence (I), head severity (HS) and index (FS) were determined from a twenty grain head sample collected at Feekes 11.2 growth stage. Leaf severity was determined from a sample of five leaves at the same growth stage. Plots were harvested 22 Aug with a small plot combine and the yield and test weight determined. Deoxynivalenol accumulation (DON) was determined by the NDSU

Toxicology Lab. Data were analyzed with the general linear model (GLM) in SAS. Least significant (LSD) were used to compare means at the P≤0.05 level.

Results

Strobilurin fungicides are recommended by extension pathologists for control of foliar diseases in small grains. Some researchers have reported elevated DON levels when strobilurin fungicides have been applied for foliar disease control. Divide durum is one of the most resistant durum cultivars to FHB. Durum as a class is possibly the most susceptible wheat to FHB. Fungicide treatments that included a triazole fungicide increased yield compared to the untreated with the exception of Stratego YLD, Table 1. Treatments that were applied at Feekes' growth stage (GS) 10.51 increased test weight and 1000 seed weight. In addition, Headline applied at GS 10.5 increased seed weight. Fusarium head blight incidence was reduced by treatments applied at GS 10.51. The sequential treatment (Headline followed by Prosaro) was more effective than all other treatments in reducing FHB incidence. Fusarium head blight index and head severity were both reduced by the treatments applied at GS 10.51. No differences in leaf diseases were determined. Leaf disease severity was low. Only the Cogito treatment reduced the Fusarium damaged kernels (FDK) in the grain sample. However, there appeared to be a trend toward elevated FDK and DON levels compared to the untreated by many of the strobilurin treatments. Four treatments, Cogito, Caramba, Prosaro and Headline followed by Prosaro were very effective in reducing DON compared to the untreated and all other treatments.

^a Induce adjuvant added to all fungicides except Cogito. GS = growth stage. FDK = Fusarium damaged kernels. DON = deoxynivalenol accumulation in the seed.

Seeding Rate Effect on Yield and other Agronomic Traits of Soybean-2011

Bryan Hanson and Richard Wilhelmi, NDSU Langdon Research Extension Center

Seeding rate trials were embedded in the soybean variety trials at the Langdon Research Extension Center and the off-station trial in Walsh County near Voss. Seeding rates were adjusted for seed size and germination (90%) and ranged from 125,000 to 250,000 pure live seed per acre (pls/a). The variety Dyna-Gro 30RY04 (maturity group 00.4) was planted at Langdon while Dyna-Gro 30YR07 (maturity group 00.7) was planted at Voss. Planting dates were May 20 and June 1 for Langdon and Voss, respectively. Both locations were not affected by the frost and harvest dates were September 28 and September 29 for Voss and Langdon, respectively.

The LSD 5% and CV% were determined using all data from the entire variety trial at both locations. Seeding rate appeared to have little effect on maturity dates at both locations. Plant height, lodging, protein and oil differences among seeding rates were non-significant at both Langdon and Voss. The yield at the 125 and 150,000 pls/a seeding rates at Voss were significantly lower than 200, 225, and 250,000 pls/a seeding rates. The lowest seeding rate at Langdon had a significantly lower yield than the two highest seeding rates. There was no significantly differences in yield between the 150 and 250,000 pls/a seeding rates. Results from these two studies indicate that a seeding rate between 175 and 200,000 pls/a would result in optimum yields.

Walsh County - Voss

Seeding Rate pls/a	Maturity Date	Height (in)	Protein %	Oil %	Yield bu/a	2-site Yield

Canola Seeding Date Effect on Yield and other Agronomic Traits-Langdon 2010-2011

Bryan Hanson and Richard Wilhelmi - NDSU Langdon Research Extension Center

Canola seeding date trials were established in 2010 and 2011 at the Langdon Research Extension Center. Two hybrid cultivars were used; Liberty Link InVigor 8440 and Roundup Ready DKL 30-42. The trial was conducted using best management practices for canola including seeding rate, fertility, weed control , fungicide and harvest management.

The trial in 2010 had poor emergence the first 3 dates. We received 2.04 inches of rains between the April 29 and May 10 seeding date. Rainfall between seeding dates of May 10 and May 21 was 0.81 inches . Rainfall between seeding dates of May 21 and June 1 was 2.80 inches. Planting depth was between 3/4 and 1 inch but was often deeper with soil washing after rains. Crusting was also a factor. Rainfall and temperatures were above normal for the growing season. Yields were very good despite the early poor stands which demonstrates canola's ability to compensating for poor stands.

Soil conditions were very saturated from fall rains and winter's snow in the 2011 trial. The first planting date of May 9 was much earlier than any canola that was planted in the area. Stands were very good with no soil crusting after each date. July and August were both 2.5 degrees above normal for temperatures. There was only one day with temperatures over 90 deg. The increase in average daily temperatures came from warmer nights. Moisture was near normal in June and July and 1.8 inches below normal in August. There was no apparent moisture stress in the trial.

Planting date effects on yield were non-significant in 2010. The May 19, June 9 and June 16 planting date in 2011 had significantly higher yields than the May 9 planting date. Percent oil tended to decrease with later planting dates. Canola performed very well at the later seeding dates under the environmental conditions observed in 2010 and 2011.

LREC Foundation Seed Increase Program

The Langdon Research Extension Center produces, conditions, and sells Foundation grade seed for producers and seedsman in the region. The varieties of crops that are available for the 2012 growing season are listed below:

HRSW – Glenn, Faller, Prosper

Durum – Lebsock

Barley – Celebration

Flax – Rahab 94

Growers who have grown seed for certification in one of the last four years who request seed prior to December 1 will be guaranteed an allocation. Any seed inventories available after December 1 will be sold on a first come, first serve basis. Seed availability and prices may be obtained by calling the Langdon Research Extension Center.
