Overview	3
2010 Crop Management-Langdon.....	4
2010 Off-Station Crop Management.....	5
Weather Observations	6-9
Average Data by Crop and Year across Sites for Durum, Barley and HRSW.....	10-11
Langdon HRSW	12-13
Off-Station HRSW	14-17
HRSW Diseases	18
Langdon Durum	19
Off-Station Durum	20
Durum Diseases.....	21
HRWW.....	22-24
Langdon Barley	25-26
Off-Station Barley	27
Oats and Oat Disease.....	28-29
Flax	30
Canola - Conventional.....	31-32
Canola - Roundup Ready	33-36
Drybean	37
Field Peas	38
Conventional Soybeans	39
Roundup Ready Soybeans.....	40-45
Sunflowers.....	46-48
Corn	49
Mustard, Buckwheat, Camelina	50
Crop Disease Research.....	51-62
Foundation Seed Increase.....	63

The 2010 annual research report is intended to provide producers information to aid in selecting varieties and/or hybrids. Variety information and research reports on crop disease and production can also be found at our website www.ag.ndsu.edu/langdon/. Variety trial results from all NDSU Research Extension Centers and the Main Station at Fargo, along with crop extension bulletins, can be accessed on the Web at www.ag.ndsu.edu/varietytrials/.

Choosing a variety is one of the most important decisions a producer makes in successful crop production. Characteristics to consider in selecting a variety may include yield potential, disease resistance, protein content when grown with proper fertility, straw strength, plant height, test weight, yield stability across years and locations, quality and economic profitability. A variety's performance may differ from year to year and from location to location within a year due to varying environmental conditions. When selecting a variety to grow it is best to consider a variety's performance over several years and locations.

The agronomic data presented in this publication are from replicated research plots using experimental designs that enable the use of statistical analysis. The trials are designed so that "real" yield and agronomic differences can be statistically separated from differences that occur by chance. The least significant difference (LSD) values given in the report are used for this purpose. For example, if the LSD 5% is 5 bushels, then if the difference between any two varieties is greater than 5 bushels they are said to be significantly different from one another 95 times out of 100 under those growing conditions. If the difference between two varieties is less than 5 bushels, they are not significantly different from one another. If there is a "NS" for LSD 5% value it means there was no real difference between any varieties or the trail was too variable to detect a real difference. The CV stands for coefficient of variation and is expressed as a percentage. The CV is a measure of variability in the trial. Large CVs mean a large amount of variation that could not be attributed to differences in the varieties or agronomic characteristic.

The NDSU Langdon Research Extension Center, in addition to its on-station research program, conducted variety research trails at five off-station locations in 2010. Trial locations were at Cavalier, Park River, Lakota, Devils Lake and Cando. These locations are in cooperation with the farmer, the Extension Service and the County Agricultural Improvement Association.

2010 Weather Summary

Fall recharge at Langdon for September through October 2009 was 4.35 inches, 1.16 inches above normal. Precipitation from November 2009 through March 2010 was 3.05, 0.85 inches below normal. Spring planting began the last couple weeks of April but was interrupted by a two week rainy period. Rainfall was generally above normal across the region April-September except for July. Temperatures were also above normal for all months except September. This was especially favorable for the warm season crops. Yields were generally good to excellent across the region. Some areas received too much rainfall early in the growing season resulting in saturated soil conditions and poor plant growth. Harvest conditions were excellent until September when an extended period of wet weather result in little harvest until later September when weather turned warm and dry.

2010 Crop Management - Langdon						
Field Trial	Previous Crop	Seeding Rate Unit/Acre	Yield Goal	Planting Date	Harvest Date	Row Spacing
Barley	soybean	1.25 million pls	120 bu	4/22	8/3	6
Buckwheat	soybean	700,000 pls	1700 lb	5/27	9/27	6
Camelina	soybean	5 lbs	1500 lb	5/17	8/25	6
Canola - LL, CL	soybean	610,000 pls	2500 lb	5/17	8/27	6
Canola - RR	soybean	610,000 pls	2500 lb	5/17	8/28	6

NoF = No Fungicide, wF = Prosaro at early flower, 6.5 oz/a + NIS 0.125% v/v
2009 had very low levels of leaf rust and FHB

Winter Cereals

Sustainability in Action

Winter Cereals Sustainability in Action, in northeast ND, is a joint research and education initiative between Ducks Unlimited, Bayer Crop Science, NDSU Extension Service and NDSU Langdon R/E Center. The objective is to improve agricultural productivity of winter wheat. Thus, increasing winter wheat acres to provide improved habitat for wildlife in areas with low levels of grassland. This program now provides all salaries and operating funds for the winter wheat effort based at the NDSU Langdon R/E Center. Fungicide, fertility and weed control research on winter wheat is also in progress. Contact John Lukach at the Langdon R/E Center for additional information.

¹ Performance index identifies hybrids that are outstanding for grain yield and moisture. This index helps identify early hybrids with high productivity. High ratings(greater than 100) suggest better than average performance.

Total GDD for the trial was 1690, 61 above normal. First killing frost was October 2, 28° F.

Evaluation of foliar fungicide on several HRSW cultivars and two durum cultivars, Langdon 2010

Bryan Hanson, Agronomist, NDSU Langdon Research Extension Center
Scott Halley, Crop Protection, NDSU Langdon Research Extension Center
Dr. Senay Simsek, Wheat Quality, NDSU – Fargo.

Materials and Methods

A field experiment was planted on 14 May at the North Dakota State University Langdon Research Extension Center located at Langdon in NE North Dakota. The trial was conducted using best management practices for hard red spring wheat including seeding date and rate, fertility, weed control and harvest management. The experiment was a randomized complete block design with a split plot arrangement with four replications. The previous crop was soybean. The soil type was Svea-Barnes loam. Whole plot factors were cultivars; all cultivars were seeded at a rate of 1.5 million pure live seeds /acre. Subplot factor were Prosaro fungicide or untreated. Plots seven rows wide by 21 ft. long, 6-in row spacing, were planted with an Almaco plot planter equipped with double disk openers and press wheels. Fusarium inoculums consisting of two isolates were hand-broadcast at a rate of 150 grams /plot two and three weeks prior to flowering to encourage development of Fusarium head blight disease (FHB). After herbicide application was completed, an overhead irrigation system was installed to provide supplemental water to wet the Fusarium inoculum and the grain heads to encourage the development of FHB. The Prosaro fungicide was tank mixed with Induce adjuvant at a rate of 6.5 fl. oz. /acre and 0.25% v/v, respectively and applied with a CO₂-pressurized backpack sprayer operated at 40 psi and delivering 18.4 GPA. The sprayer was equipped with a three-nozzle boom, nozzles spaced 20 inches on center. The foliar treatments were made using Spraying Systems XR8002 nozzles oriented vertically. The flowering treatments were made using Spraying Systems XR8001 nozzles mounted on a double swivel and oriented to spray forward and backward 30 degrees downward from horizontal. The fungicide applications were made at Feekes growth stage 10.5.1. Because of the different growth of the cultivars they reached growth stage Feekes 10.5.1 on three different dates. The fungicide applications were on 6 Jul (wind speed ten MPH, temperature 64° F at 8:15 a.m., cultivar Brick), 9 Jul (wind speed five MPH, temperature 66° F at 8:30 a.m., cultivars, Dapps, Briggs, Glenn, Steele-ND, Trooper, Howard, Barlow, Brennan and Traverse) and 12 Jul (no wind, temperature 50° F at 8:00 a.m., cultivars, Ada, Alsen, Faller, Sampson, Reeder, Sabin and Granger) by maturity. Fusarium head blight (FHB) incidence (I), head severity (HS) and index (FS) were determined from a twenty grain head sample collected at Feekes 11.2 growth stage. Leaf severity was determined from a sample of five leaves at the same growth stage. Plots were harvested 7 Sept with a small plot combine and the yield and test weight determined.

The fungicide treatment had a significant effect on all characters measured except heading date. Yield, test weight and DON averaged over cultivars was 7.6 bu/a higher, 1.1 lb/bu higher and 1.66 ppm lower, respectively, compared to the untreated treatment. The fungicide x cultivar interaction for yield was non-significant meaning all cultivars had similar yield responses to fungicide. There was significant fungicide x cultivar interactions for other characteristics which indicates the differences between the fungicide and untreated treatments varied among cultivars.

Table 1. Heading date, yield, test weight, Fusarium head blight incidence, index and head severity, deoxynivalenol and leaf necrosis by cultivar or fungicide, Langdon 2010.

FLAX FUNGICIDE APPLICATION FOR REDUCING THE EFFECTS OF PASMO DISEASE

S. Halley¹, B. Schatz² and M. Wunsch², and S. Markell³ and F. Mathew³, North Dakota State University¹Crop Protection Scientist Langdon Research Extension Center, ²Director and Research Agronomist and Research Plant Pathologist Carrington Research Extension Center, Carrington, ND, ³Extension Plant Pathologist and Research Specialist, Plant Pathology Department, Fargo, ND.

Contact info: 9280 107th Ave NE, Langdon, North Dakota 58249 Ph. 701.256.2582 E-mail Scott.Halley@ndsu.edu

MATERIALS AND METHODS

This study was designed as a randomized complete block with four replicates, and was conducted at the Langdon Research Extension Center, NDSU at Langdon, North Dakota (N48° 45.3', W98° 17.5') and conducted in 2010. Plots were 7 rows wide 6-inch spacing between rows and 20 ft. row length and were planted with a double disk Almaco plot drill on 9 May. Seeding rate was 2.8 million PLS^{-acre}. An untreated plot was planted between treated plots to collect and minimize spray drift to the adjacent plots. Crop production practices recommended by North Dakota State University Extension Service were followed (Kandel, 2007).

The Canadian cultivar CDC Bethune was used in this study. The plots were artificially inoculated with pasmo by spreading infected straw collected from 2009 in the center of each plot 6-8 days prior to the initiation of flowering at the rate of 80 grams of straw. Treatments are listed in Table 1. Early flower growth stage application was made on 6 Jul (wind speed 10 MPH from the W and air temperature 66° F at 9:30 a.m.) and late bloom growth stage application on 14 Jul (wind speed 2 MPH from the SW and air temperature 66° F at 9:00 a.m.). An untreated check was included as a control (Table 1). Fungicide was applied with a CO₂ backpack spray unit equipped with a three nozzle boom operated at 40 psi with Spraying Systems XR8001 nozzles oriented vertically delivering 9.2 GPA.

The soil type was a Barnes/Svea complex (fine-loamy, mixed superactive Frigid, Calcic Hapludolls)/mixed superactive Frigid, Pachic Hapludolls (Soil Survey Staff, 2008). Hard red winter wheat was produced on this site in 2009. The soil was tilled in the fall with a chisel plow with attached spring tooth harrows once. In spring prior to planting and tilling, N fertilizer (28-0-0) was broadcast on the site to bring the soil and applied N level to 75 lb. acre⁻¹. The site was tilled with a spring tooth cultivator equipped with 23 cm sweeps on 18 cm spacing with attached spring tooth harrows immediately before planting.

Pasmo disease was assessed on leaves on 6, 13 and 21 Jul and 3 and 19 Aug and the stems on 21 Jul and 31 Aug. The leaves were assessed using the 1-9 scale with 1 = no sign of disease and 9 = high disease severity and leaf death. Stem severity was assessed using the 1-9 scale with 1 = no sign of disease and 9 = high disease severity and plant death. The plot was harvested on 25 Aug with a Hege plot combine and

the threshed sample collected. Yield, test weight, seed weight and oil concentration were determined. Area under disease progress curve (AUDPC) was calculated for each location. The data were analyzed with analysis of variance separating means with Fischer's protected least significant differences ($P \leq 0.01$) with SAS (SAS, 1999).

Results and Discussion

The supplemental watering system was not used in 2010 due to excessive distance from the water source. Pasmo disease developed less intensely in 2010 than in previous studies that received supplemental water. The flax matured earlier in 2010 than 2009 and was harvested nearly a month earlier. At the 6 Jul assessment date the Headline treatment had lower disease score than Quash (3 oz. /a), Q8X63, Stratego Pro with Induce, Picoxytrob in with Induce and Luna Privilege with Induce, Table 1. No differences in foliar disease were measured on 13 Jul. At the 21 Jul assessment date Quash (4 oz. /a), both Picoxytrob treatments without Induce and LEM17 had lower disease scores than some of the other fungicides. Only the picoxytrob treatments had lower disease scores than the untreated. At the 3 Aug assessment date several treatments were statistically better than the untreated. The list includes all treatments **except**; LEM 17 and Quash. At the 19 Aug all the leaves had senesced. Several treatments had lower disease levels than the untreated when comparing the AUDPC (area under the disease progress curve. These treatments included both two fungicide application treatments, both Picoxytrob without Induce and Q8X63, ProPulse with Induce and both Stratego Pro treatments. Pasmo was not present on the stem at the first sample date and at very low levels at the second sample date. No differences were measured with this assessment indicating a questionably value in quantifying disease with this method in some environments. Many of the disease survey assessments use incidence on the stem to determine prevalence of Pasmo. Several treatments increased yield. The most effective treatments were two fungicide timings and the Stratego Pro with Induce. Ineffective treatments for increasing yield included LEM17, ProPulse and Quash as a single treatment. Only the high rate of LEM17 and Quash failed to increase test weight over the untreated. All fungicide applications increased seed weight compared to the untreated. Oil was not statistically affected by fungicide treatment in this study. All fungicide applications reduced the dark brown damaged seed count in the sample compared to the untreated. No differences were determined for damage seed for black or scabby seeds. In previous studies at Langdon we have been unable to isolate any pathogen from any of the visually scabby seed. This damage may be related to weathering which would not be affected by a fungicide application.

Headline, the only commercially labeled fungicide for use on flax again increased yield over the untreated. Several other fungicide treatments also were effective in increasing yield. Some of the new fungicides offer different mode of action and should benefit growers if a label could be obtained. The results of this study and the Carrington study will be forwarded to the fungicide suppliers in hopes of generating interest in further testing and label acquisition of one or more of the fungicides for use on flax.

LREC Foundation Seed Increase Program

The Langdon Research Extension Center produces, conditions, and sells Foundation grade seed for producers and seedsman in the region. The varieties of crops that are available for the 2011 growing season are listed below:

HRSW – Glenn, Faller

Durum – Lebsock

Barley – Lacey, Celebration

Flax – Rahab 94

Growers who have grown seed for certification in one of the last four years who request seed prior to December 1 will be guaranteed an allocation. Any seed inventories available after December 1 will be sold on a first come, first serve basis. Seed availability and prices may be obtained by calling the Langdon Research Extension Center.
