

ALFALFA INTER-SEEDING TRIAL – 1983**Dickinson Experiment Station**

Llewellyn Manske

The Alfalfa Inter-seeding trial is separated into four separate segments. These are: Alfalfa Inter-seeding Row Spacing Techniques Trial, Alfalfa Inter-seeding Furrow Width Techniques Trial, Inter-seeded Alfalfa Variety Response to Grazing Trial and Alfalfa Variety Establishment by Broadcast Seeding into Rangeland Trial.

The personnel at the Dickinson Experiment Station built an inter-seeding machine during the winter of 1982-83. The plans from a machine designed and tested at South Dakota State University (Chisholms et al. 1980) were used for the construction with slight alterations. This inter-seeder was used to establish the alfalfa inter-seeding plots in 1983.

ALFALFA INTER-SEEDING ROW SPACING TECHNIQUES TRIAL

This trial was designed to evaluate alfalfa inter-seeding into rangeland with different intervals between the rows. The intended purpose of the data will be primarily to assist in the determination of a recommended row spacing or row spacings for alfalfa inter-seeding into rangeland for pasture use in western North Dakota.

These plots were established on one acre located on the NE $\frac{1}{4}$, NW $\frac{1}{4}$, SW $\frac{1}{4}$ Sec. 23, T. 143 N., R. 96 W. at the ranch headquarters of the Dickinson Experiment Station. The 33 X 50 foot plots were arranged in a randomized block design with three replications. The soil is vebar fine sandy loam. The range site is sandy with a few thin claypan sites. Travois alfalfa was seeded at a rate of 0.50 lbs PLS/row/acre on 21 April 1983. A four inch twisted chisel plow shovel was used as the furrow opener. The intervals between the rows were 2, 3, 4, 5, 8 and 10 feet. A control plot of no inter-seeding was included in each replication.

The data that were collected from these plots were: above ground herbage production separated into nine categories, alfalfa seedling counts per meter of row, species composition by point frame and forb densities by use of one tenth square quadrats.

The above ground herbage production was sampled by clipping the vegetation to ground level in three $\frac{1}{4}m^2$ quadrats for each plot on 21 July 1983. The herbage was separated into nine categories: cool short, warm short, cool mid, western wheatgrass, warm mid, warm tall, sedge, forbs and shrubs. The samples were oven dried at 80°C. The dried samples were then weighed in grams. The average weight of each category for the three $\frac{1}{4}m^2$ quadrats was determined and the average pounds per acre of herbage production was calculated for each category by multiplying the average weight in grams by 35.68. The total average production for each plot was found by the summation of the average pounds per acre for each category. The reported figures are means of the three replications for each treatment.

The alfalfa seedling counts were made by counting the number of seedlings along two randomly placed meter sticks for each row of each plot. The mean number of seedlings per meter of row was determined for each treatment. Seedling counts were conducted on 23 June and 30 August 1983.

Quantitative species composition data for each plot was collected on 22-23 August 1983. The herbaceous plants were sampled by the ten pin point-frame method (Levy and Madden 1933, Tinney, Aamodt, and Ahlgren 1937, Heady and Rader 1958 and Smith 1959). Fifteen hundred points were read for each treatment (500 points per plot). A systematic sampling scheme was used for each plot. A permanent major transect was established three feet inside and parallel to the east boundary of each plot. Five minor transects were established perpendicular to the major transect at nine foot intervals starting nine feet from the south boundary of the plot. One hundred points were read on each minor transect equally spaced across the plot.

Forb and shrub densities were sampled by the use of one tenth meter square quadrats on 22-23 and 30 August 1983. The forbs and shrubs that were rooted within the frame were counted by species in each of the 25 quadrats per plot. Five 0.1 m^2 quadrats were spaced at 6 foot intervals along each of the five minor transects.

ALFALFA INTER-SEEDING ROW SPACING TECHNIQUES TRIAL

Location:	Dickinson Experiment Station Ranch Headquarters NE $\frac{1}{4}$, NW $\frac{1}{4}$, SW $\frac{1}{4}$ Sec. 23, T. 143 N., R. 96 W.	
Replications:	Three Randomized Block Design	
Study Size:	183' X 241'	1.01 acres
Plot Size:	33' X 50'	0.04 acres
Perimeter Border:	10' on west and south, 3' on north and 0' on east	
Alleys:	10'	
Soil:	Vebar	
Range Site:	Sandy with a few thin claypan sites	
Seeding Date:	21 Apr 1983	
Seeding Rate:	0.50 lbs. PLS/row/acre	
Alfalfa Variety:	Travois	
Chisel Plow Shovel:	4" twisted	
Row spacings:	0, 2, 3, 4, 5, 8 and 10 foot	

Table 1. Mean Above Ground Herbage Production by Category in Lbs/Acre for the Alfalfa Inter-seeding Row-spacing Techniques Trial at the Dickinson Experiment Station, 1983
